1. Introduction

SHARE - Stations at High Altitude for Research on the Environment - is an integrated environmental project promoted by Ev-K2-CNR in 2005 with the support of Italian and International research institutions and in collaboration with the United Nations Environment Program (UNEP). The project is focused on mountain regions as primary indicators of climate change and it responds to the call of international and intergovernmental institutions for improving environmental research in high mountain regions. SHARE specific aim is to improve scientific knowledge on climate variability in mountain re-

gions, by ensuring the availability of long term, high quality data. Originally launched as a system of measurements in environmental and earth sciences in the Himalaya - Karakorum region, SHARE, has later expanded its network to Europe (Apennines and Alps), Africa (Rwenzori) and more recently to South America (Andes).

Now, more than fifteen stations are installed around the world, at several altitudes, from 2165 m to 8000 m a.s.l. and regularly supply data on meteorological and atmospheric conditions, the most of them are available in real time.

Tab. 1 - List of SHARE stations

Data collected at high altitude in the SHARE project provide unique information to several international climate-environmental monitoring programs, as like as UNEP-ABC, WMO-GAW, NASA AERONET, ILTER, EUSAAR, and ACCENT.

The data collected by the AWS installed on glacier surface are also essential for measuring energy fluxes at the glacier-atmosphere interface and snow accumulation, for calculating the energy available for snow/ice melt, for the validation of mass balance models, meteorological models (regional/mesosca-

le) and satellite products, for constructing parameterizations for energy balance models (Senese et al., 2012; Senese et al., 2012). These data play an important role in characterizing glacier surface and sky conditions too. For example albedo and cloudiness are the most important parameters that determine the amount of solar radiation adsorbed at the surface (apart from geometric effects like shading): at the glacier surface the solar radiation mainly drives ice and snow melt.

1.1 AWS QUALITY CONTROL

In spring 2011, in the framework of the SHARE project, the calibration activities of the automatic weather stations have been strengthened thanks to the use of a mobile Quality Control automatic weather station (AWS QC).

This action, necessary to guarantee high quality measurements and check the state of the stations, was started in Nepal, where the most of AWSs are installed and then it will continue systematically in the other countries in order to calibrate all AWSs.

The AWS QC is equipped with sensors and acquisition systems with uncertainties, known and certified (see table below).

In the first experimental campaign the AWS QC was installed near the CEOP - Pyramid for two weeks and after this period the AWS QC was dismantled and its data were compared with those recorded from the CEOP- AWS Pyramid for the same period.

The data comparison has permitted to identify a few problems on the permanent station that were successively restored.

In autumn 2011, the AWS QC was installed near the permanent AWS at Kala Patthar. In this site the AWS QC worked from November 20 to December 8.

As done in the spring, also in autumn the data comparison of AWS QC and AWS KP has permitted to replace the malfunctioning sensors.

Fig. 1 - AWS QC installed near the AWS KP

2. Sites description

2.1 NEPAL

The SHARE activities, in Nepal, are carried out mainly along the Khumbu Valley located in the central part of the Himalayan range and partially include the Sagarmatha National Park area. Thanks its location, this valley represents a strategic area to study climate change and its effects on mountain ecosystems, containing the southern half of Mount Everest and its summit.

The area is characterized by poor annual mean precipitation mostly concentrated during the summer monsoon season. Winter synoptic circulation is dominated by western streams (westerly) bringing events which lead to snowfalls in the western and central Himalayan Range and the Tibetan Plateau.

In summer, southern monsoon streams dominate carrying damp ocean air toward the interior of the continent. Throughout all seasons except for the monsoon, an intense southern valley breeze blows during the day, contrasted by a less intense northern mountain breeze at night.

In this region a network of nine automatic weather stations and one atmospheric laboratory has been installed since 1994 m and covers an altitudinal range from 2660 to 8000 m a.s.l. (Fig. 1). In particular, the meteorological stations that constitute the SHARE Network in Nepal are located in Lukla (2660 m a.s.l.), Namche (3570 m a.s.l.), Periche (4.260 m a.s.l.), Lobuche at Pyramid (5050 m a.s.l.), Kala Patthar (5600 m a.s.l.), Changri Nup (5700 m a.s.l.) and South Col – Mount Everest (8000 m a.s.l.).

Most of automatic weather stations take hourly measurements of seven standard meteorological parameters: temperature, relative humidity, atmospheric pressure, wind speed and direction, global solar

radiation and total precipitation.

At Pyramid and Lukla, stations have been implemented by sensors for the determination of soil parameters (temperature, water content, and thermal flux) and four components of radiation.

Since February 2010 the Changri Nup station has been included in the network. This station is located on the glacier at 5700 m a.s.l. and takes every thirty minutes measurements of temperature, relative humidity, wind speed, wind direction and four components of radiation.

On May 2011, after a period of test during summer 2008, an automatic weather station has been re-installed at South Col, near summit of Mount Everest. This station was equipped with technologically-advanced sensors for measuring temperature, humidity, wind speed and direction, atmospheric pressure and solar radiation. Support, energy and data transmission systems are optimized for functioning in adverse weather conditions.

Since 2006, near the International Laboratory Observatory Pyramid, the Nepal Climate Observatory-Pyramid has been installed at 5079 m a.s.l. and regularly collects data on the most important atmospheric parameters. This station is installed in a key area to study the background atmospheric condition of Khumbu Valley and improve knowledge on Atmospheric Brown Cloud (ABC) phenomenon.

NCO-P supplies essential information to international scientific community in the study of ABC phenomenon and thanks its contribution this station represents the 34th Global Station in the framework of Global Atmospheric Watch – World Meteorological Organization (GAW-WMO).

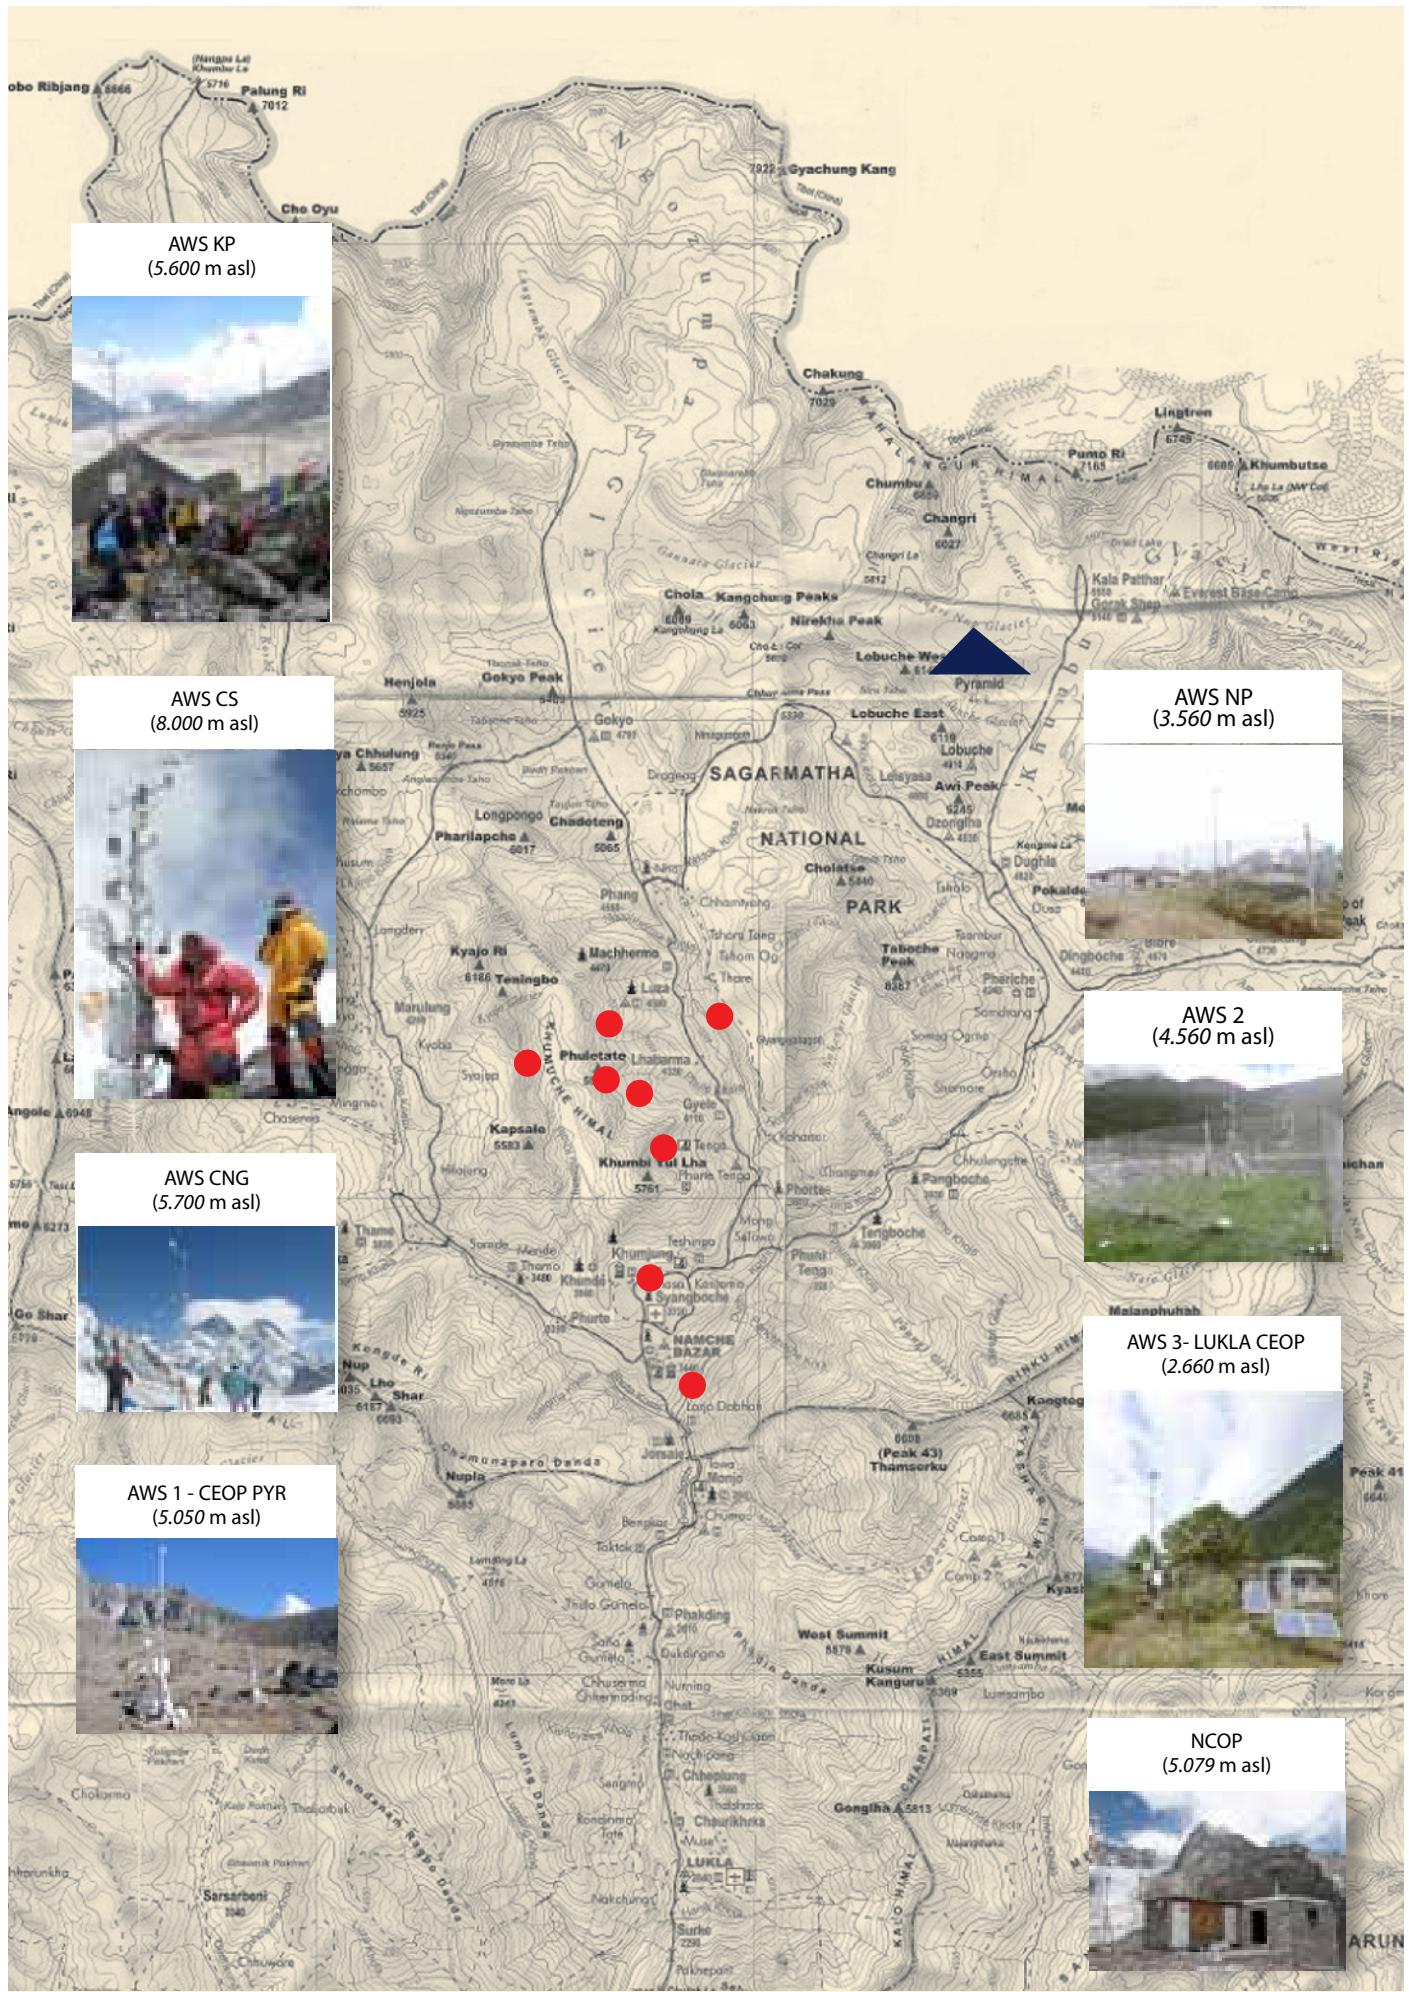

Fig. 2 Map of the stations installed in Sagarmatha National Park.

2.2 PAKISTAN

In Pakistan, the SHARE activities are focused in Central Karakorum National Park (on Baltoro Glacier).

The climate in high altitude mountains of the Northern Areas is influenced by the broad global circulation patterns associated with the position in the continental mass and the proximity to the oceans. During the winter and spring period the Karakoram area is influenced mainly by a broad scale weather system originating primarily from the Mediterranean or from the area of the Caspian Sea and from air mass convective storm in the pre-monsoon season.

In spite of climate changes, studies carried out on Baltoro Glacier show small and limited variations its extension in the last 50 years. In fact this zone is characterized by low temperatures and a climate very wet. The different activity of Baltoro Glacier in respect to most of the mountain glaciers is most likely due to the different supraglacial conditions characterizing its glacier tongue. On Baltoro Glacier the debris insulation effect allowed a larger quantity of ice in the glacier tongue to be conserved. The climate isn't influenced by monsoons and precipitations present a regular trend.

In this region tree Automatic Weather Stations are installed. Specifically, in Central Karakorum National Park, at Urdukas and Askole the stations

have been working respectively since 2004 and 2005 and are supplying unique information, useful to characterize meteorological and cryospheric conditions of Baltoro Glacier (Palazzi et al., 2012; Bocchiola et al., 2012; Mihalcea et al., 2008; Smiraglia et al., 2007).

In this region tree Automatic Weather Stations are installed. Specifically, in Central Karakorum National Park, at Urdukas and Askole the stations have been working respectively since 2004 and 2005 and are supplying unique information, useful to characterized meteorological condition of Baltoro Glacier.

Both stations are recording standard meteorological parameters, since their installation moment, with hourly frequency. Moreover, since July 2011, Urdukas station has been implemented trough installation of sensor to record data regarding four components of radiation.

The same parameters recorded by Urdukas station are recorded also by a new station installed in 2011 at Concordia. AWS Concordia is located in one of most impressive world glacier basin: the Baltoro Concordia. The glaciers flowing from K2, Broad Peak, and Gasherbrum I and II plus many other are joining in Concordia and flowing out to the Baltoro glacier for 60 Km in total.

2.3 ITALY

In Italy the monitoring activities are focused on Alps and Apennines Area.

On Alps three AWSs are installed on three different Italian Glaciers. The AWS1 Forni has been installed on Forni Glacier on September 26, 2005 at 2669 m a.s.l. and its location is a good compromise between the needs for minimizing local topography effects and lowering the probability of avalanches destroying the AWS. This station represents the first Italian permanent above glacial AWS that supply a big number of information about micro-meteorological conditions on surface of an Italian Alpine glacier. In particular, this station is located in the glacial ablation area and permits to measure both the winter accumulation and the thermal conditions and in-coming/out-coming energetic fluxes that rules the losses of glacial masses during the summer period (Diolaiuti et al., 2012; Diolaiuti et al., 2011; Senese et al., 2010; Senese et al., 2010)

The AWS Dossè – Levissima is the second Italian permanent station and was installed on August 14, 2007, on Dossè Glacier. This station located at 2850 m asl permits to collect data on above glacial

thermal conditions and incoming and outgoing energetic fluxes.

This automatic weather station represent the highest Lombardy permanent station on glacier and its data can be comparable to those collected by AWS Forni in order to verify the effects of climate change on glacial size and micro-meteorological parameters (Diolaiuti et al., 2011)

The AWS Monte Bianco – Osram is the third Italian permanent automatic weather station and has been installed on December 17, 2007 on Gigante Glacier (Mt. Bianco's group), one of the most important Italian glacier group. The AWS Monte Bianco, is located about 400 m from the "Punta Helbronner" and represent the highest Italian permanent AWS on glacier. Data collected by this station permit to improve knowledge both on local micro-meteorological knowledge and to support the periglacial researches. Moreover, this station located at 3430 m asl permits to collect data on above glacial thermal conditions and incoming and outgoing energetic fluxes. Data collected by this station can be compared to the AWSs installed on Forni and Dossè glaciers.

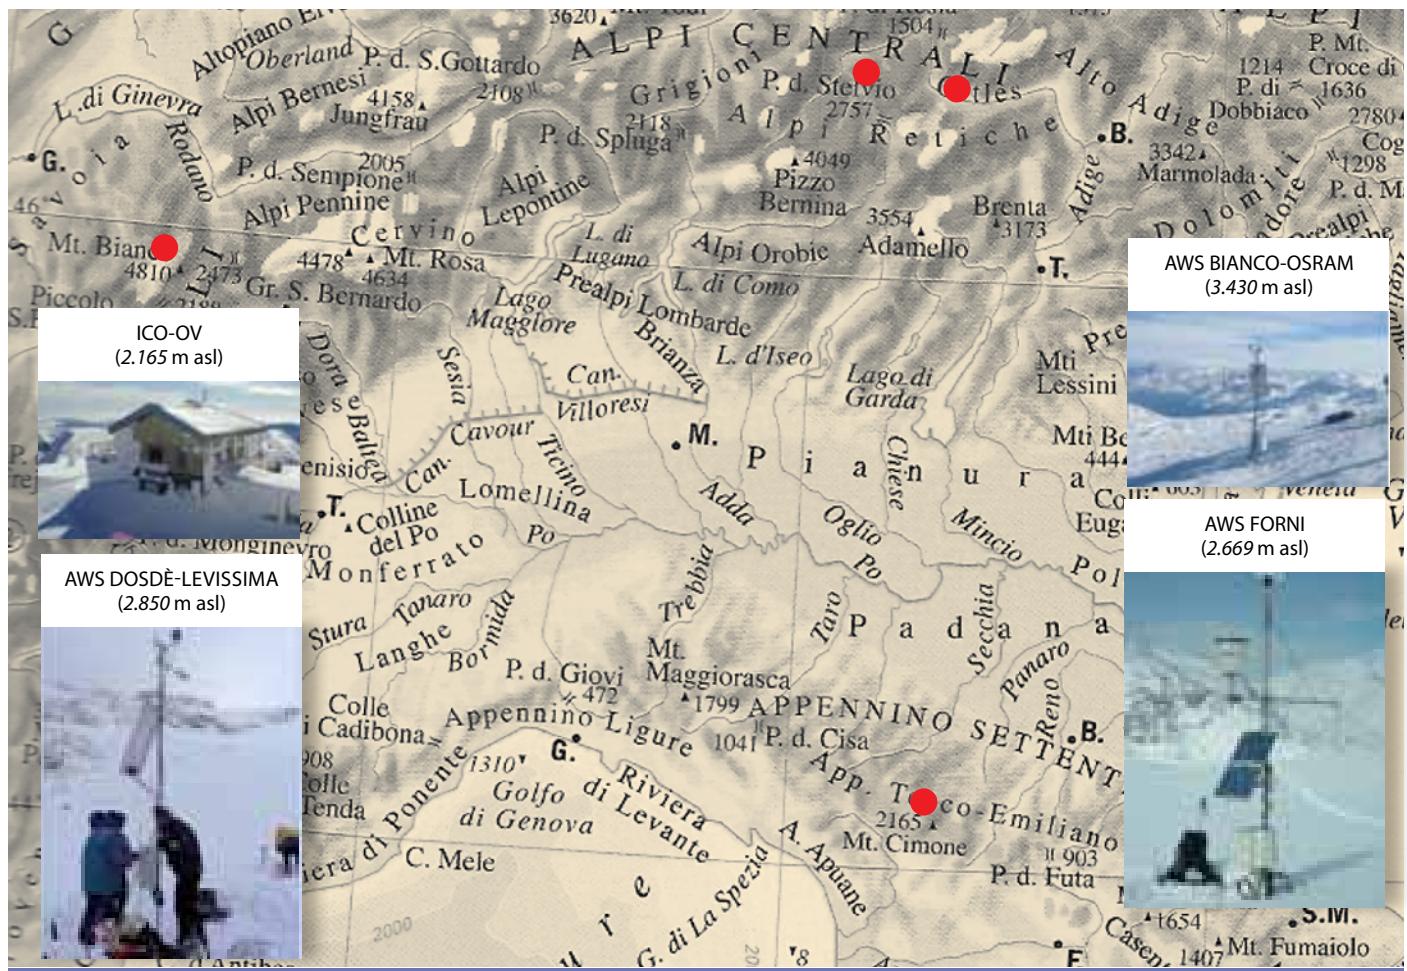

Fig. 4 - Map of the stations installed in Italy

On Apennines, at Mount Cimone is installed at Italian Climate Observatory "Ottavio Vittori" (ICO-OV). Mt. Cimone is the highest peak of the Northern Apennines on the border line of two different climatic regions: the continental Europe northwards and the Mediterranean Basin southwards.

The Italian Climate Observatory "O. Vittori" (ICO-OV), is a research infrastructure managed by the Institute of Atmospheric Sciences and Climate (ISAC) of the National Research Council (CNR). It is the only high mountain station for atmospheric research both South of the Alps and the Po basin and it represents a strategic platform to study the chemical-physical characteristics and climatology of the South Europe and North Mediterranean basin. The ICO-OV is part also of the Global Atmosphere Watch (GAW) program by the World Meteorological Organization

(WMO).

At ICO-OV, continuous monitoring of climate-altering compounds (trace gases and aerosol), solar radiation as well as meteorological parameters are carried out since 1996.

The ICO-OV activity can help to better monitor the changes of atmospheric composition, to investigate the processes influencing climate and to assess the contribution of short and long-range air mass transport to atmospheric variability.

(Cristofanelli et al., 2012; Cristofanelli and Bonasoni, 2008).

ICO-OV is part of several international networks devoted to the long-term monitoring of atmospheric properties and climate change study.

Data from ICO-OV are also used to calibrate and verify data from satellites and model simulations.

2.4 UGANDA

In Africa, the SHARE monitoring activities are focused in Uganda, in particular on Rwenzori mountain area.

The Rwenzori Mountains (called also "Mountains of the Moon"), with heights of up to 5,109 m asl., are located in the central Africa, on the border between Uganda and the Democratic Republic of Congo, in the Ugandan National Park an UNESCO World Heritage Site.

In the Rwenzori Range some of the main peaks are covered with permanent snow and glacier, while the lower slopes are covered with dense forest. Besides there are several massifs such as Point Margherita, the third highest African summit after, Mt. Kilimanjaro and Mt. Kenya.

The AWS Rwenzori (RW) has been installed, in Uganda, in the western part of the Stanley Plateau, on July 18, 2006 and it is similar to the other Ev-K2-CNR

AWSs already installed in the high altitude regions of Himalaya and Karakorum. Due to the extreme environmental conditions this station worked till 2009 and in 2013 a mission for instrument replacement will be planned.

From 2006 to 2009 this station provided continuous measurements of the seven meteorological standard parameters as like as air temperature, relative humidity, wind speed and direction, atmospheric pressure, global solar radiation and total precipitation. Meteo-climatic observations in this area are very important for the study of the environmental changes that are affecting this ecosystem, helping the scientific community to improve the prediction of the evolution of this environmental phenomena and modification (Lentini et al., 2011).

The information collected by this station will contribute to better understanding the impacts of climate change on glaciers in African Region.

Fig. 5 - Map of the station installed in Rwenzori National Park

2.5 BOLIVIA

In Bolivia SHARE activities are addressed mainly on the study of atmospheric composition. In particular, from December 2011, the ozone concentration in atmosphere is measured at Chacaltaya Laboratory.

The Chacaltaya laboratory (5.230 m a.s.l.) is the highest site for astrophysical and cosmic rays research in the world. For its location, the Chacaltaya laboratory is considered the viewpoint of Cordillera Real, on the Bolivian Andes. Built on the Bolivian Andes plateau, this laboratory is surrounded by mountains

higher than 5000m a.s.l., such as Illimani (6462 m), Mururata (5775 m), Condoriri (5696 m) and the beautiful Huayna Potosi (6088 m), one of the most scenic mountains in the world.

On this mountain the homonymous glacier found place and it has now completely disappeared, as prof. Edson Ramirez, of La Paz University, announced a couple of years ago.

Therefore, studying climate evolution in this area of South America appears more important than ever.

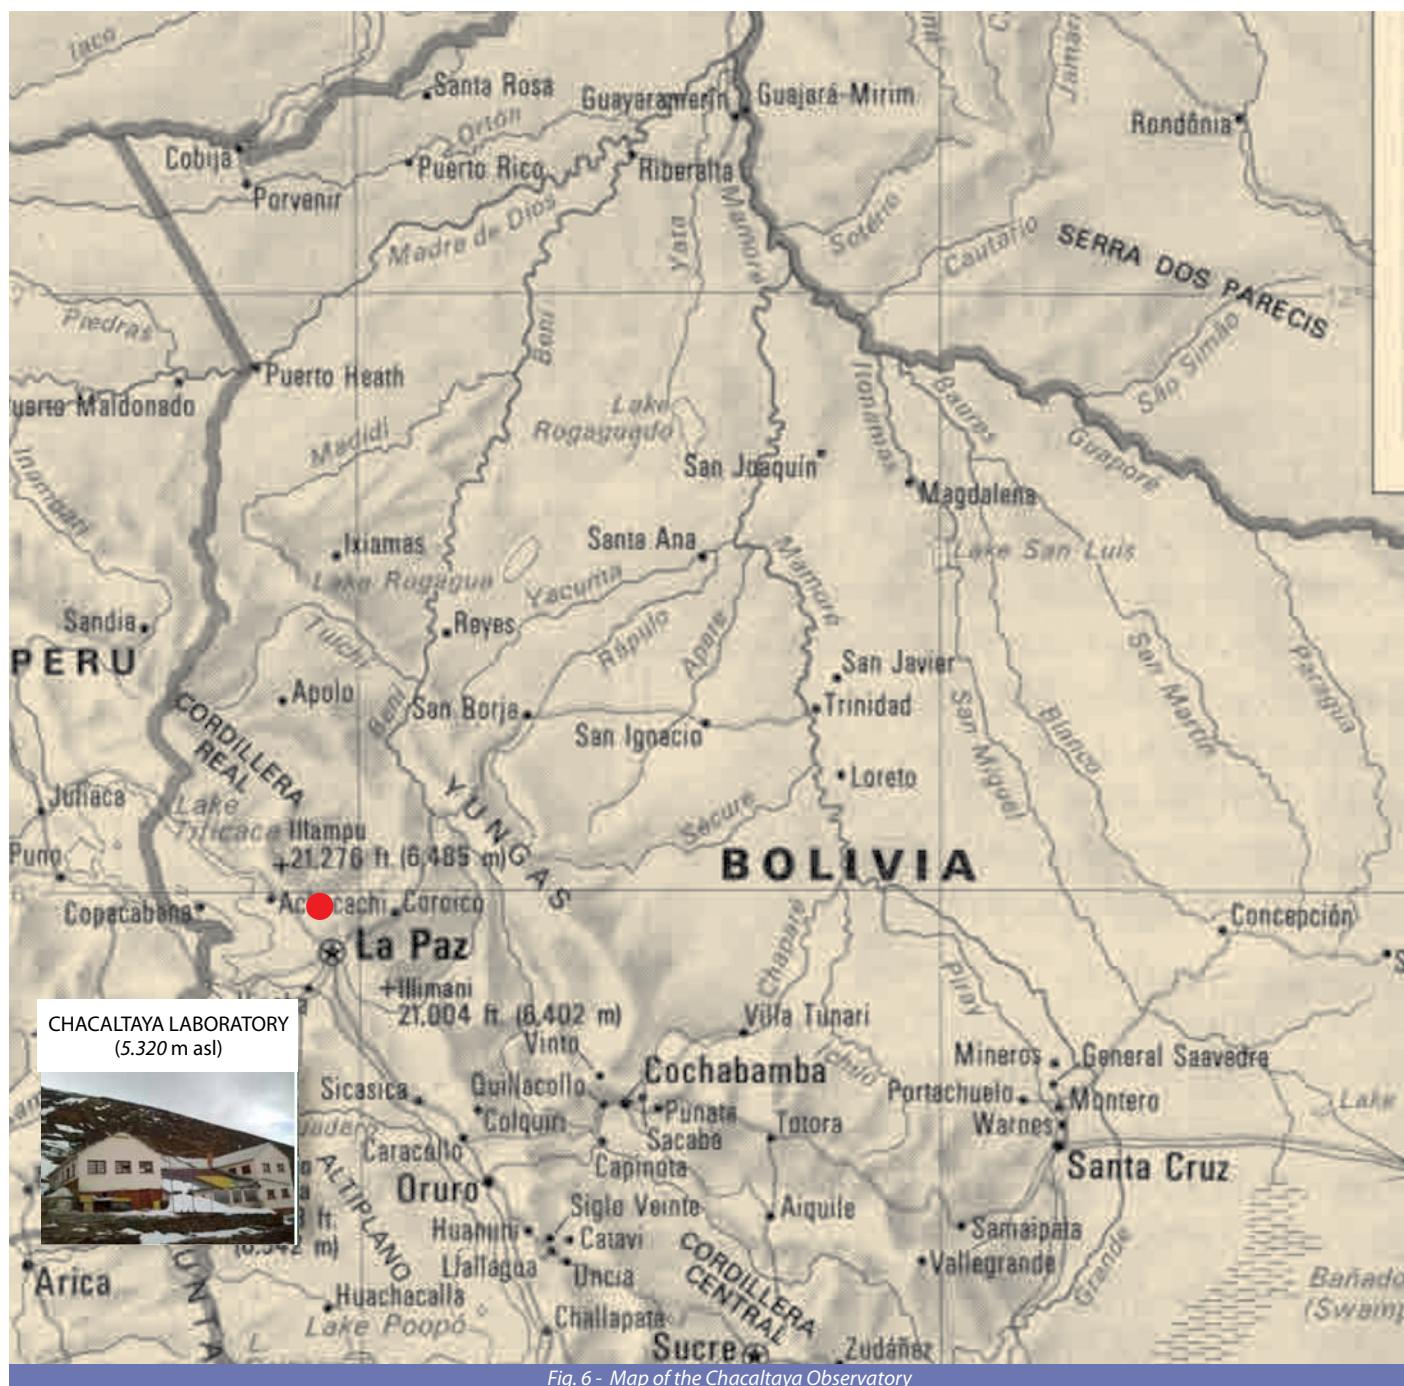

Fig. 6 - Map of the Chacaltaya Observatory

3. AWSs data

This report achieves 2011 data of all automatic weather stations and atmospheric laboratory installed in Nepal, Pakistan and Italy in the framework of the SHARE project.

For most stations there is a documentation sheet where technical information are shown, followed by tables collecting mean daily/total data for each standard meteorological parameter. For all stations, daily precipitation corresponds to the sum of hourly rain of that day.

In the tables “not available” (n.a.) is indicated when the number of hourly data were insufficient or the measurements were not performed.

For few stations like the AWS Ruwenzori, the AWS Bianco - Osram, the AWS Concordia and the Observatory of Chacaltaya 2011 data are not available or

have not been validated yet.

Regarding Italian Alps datasets, some parameters are estimated: albedo and net solar radiation from the incoming and outgoing solar radiation, net infrared radiation from incoming and outgoing infrared radiation, sky temperature from incoming infrared radiation, and surface temperature from the outgoing infrared radiation.

For each variable there are summary tables describing mean/total daily values. Values marked with an asterisk (*) have been interpolated using data from a near AWS (i.e. AWS at Federico hut closed to AWS on Doslè Glacier) due to periods in which malfunctioning sensors produced temporary gaps in data or non-sense values. The ten-day averages or total values are calculated when there are at least six days of daily data available.

Snow level	0 to 100 m	±2 cm	60 min.	3.5 m	LSI-Lastem (2)

2011 Data

In 2011 the data series of AWS Bianco - Osram show several missing data due to the bad weather conditions in which this station must work.

Technical sheet
Coordinates:

Latitude: 46° 23' 56.0" N

Longitude: 10° 35' 25.2" E

Elevation: 2.669 m a.s.l

Installation Time:

September 2005

Data Availability:

From September 26, 2005

Variable	Range	Accuracy	Recording rate	Height on Pole	Manufacturer
Data Logger				1.5 m	LSI-Lastem Babuc ABC (7)
Air Temperature	-30 - +70 °C	±0.001°C	30 min.	2.6 m	LSI-Lastem DMA570 (5)
Relative Humidity	0 - 100 %	±1%	30 min	2.6 m	LSI-Lastem DMA570 (5)
Air Pressure	400 - 800 hPa or mBar	±10hPa	60 min.	1.5 m (inside the logger box)	LSI-Lastem DQA223 (7)
Solar Radiations	0.3 - 3 µm	±5% of the value	30 min.	3.17 m	Kipp and Zonen CNR-1 (3)
Infrared Radiation	5 - 50 µm	±5% of the value	30 min.	3.17 m	Kipp and Zonen CNR-1 (3)
Snow level	0 - 1000 cm	±2 cm	60 min.	3.17 m	Sonic Ranger Campbell SR50 (4)
Liquid precipitation	0 – 1000 mm	±1mm	30 min.	1.5 m	LSI-Lastem DQA035 (2)

AWS Rwenzori

Technical sheet					
Coordinates:		 A photograph showing a tall metal mast standing on a rocky mountain peak. Various weather instruments are mounted on the mast, including a wind vane, anemometers, and sensors. The background shows a vast, misty landscape under a clear blue sky.			
Installation Time:		July 2006			
Data Availability:		From July 2006 to June 2009			
Variable	Range	Accuracy	Recording rate	Height on Pole	Manufacturer
Data Logger				2 m	LSI-Lastem BABUC
Air Temperature	-30 - +70 °C	±0.1°C (0°C)	60 min.	2 m	LSI-Lastem DMA572
Relative Humidity	0 - 100 %	1,5% (5÷95%, 23°C)	60 min.	2 m	LSI-Lastem DMA572
Atmospheric Pressure	800 - 1100 hPa (1 hPa=1 mBar)	±1hPa	60 min.	2 m	LSI-Lastem CX115P
Total Precipitation	Max 10 mm/min	1÷10mm/min: ±1%	60 min.	1.5 m	LSI-Lastem DQA030
Wind Speed and Direction	For speed: 0-60 m/s For direction: 0 ÷ 360	For speed: 0,1 m/s+1%VL For direction: 1% FS (Full scale)	60 min.	5 m	LSI-Lastem DNA022
Global Solar Radiation	<2000 W/m ²		60 min.	2 m	Kipp & Zonen CM3 pyranometer and CG3 pyrgeometer

2011 Data

The 2011 data are not available. Due to the extreme environmental conditions in which this station has been installed, acceptable meteorological data are available for the period 2006-2009. The replacement of this station is foreseen for next year.

4.1 ITALY

O. Vittori

Technical sheet

Coordinates:

Latitude: 44° 12' N
 Longitude: 10° 42' E
 Elevation: 2.165 m a.s.l

Installation Time:

January 1996

Data Availability:

From January 1, 1996

Variable	Range	Accuracy	Recording rate	Height on Pole	Manufacturer
Black carbon	Minimum detection limit (30-min): 13 ng m ⁻³	Better than 2%	1 min.	8 m	Thermo Scientific MAAP 5012
Ozone	0 - 200 ppm	± 2 ppb in the range 0-100 ppb	1 min.	7 m	Dasibi 1108

4.1 BOLIVIA

Chacaltaya Observatory

Technical sheet

Coordinates:

Latitude: 16° 12' N

Longitude: 68° 06' W

Elevation: 5.320 m a.s.l

**Installation Time:**

November 2011

Data Availability:

From December 11, 2011

Variable	Range	Accuracy	Recording rate	Height on Pole	Manufacturer
Ozone	0 - 200 ppm	± 2 ppb in the range 0-100 ppb	1 min.	8 m	Thermo Scientific Tei49i

2011 Data

The ozone data collected at the Chacaltaya Observatory have not been validated yet.

5. Acknowledgements

This study is promoted by Ev-K2-CNR and funded by the Italian Ministry of Education, University and Research (MIUR) through the Italian National research Council (CNR) and by the Lombardy region through the Lombardy Foundation for the Environment (FLA).

Installation of Italian Alpine AWSs was made possible also thanks to some public and private corporations (San Pellegrino-Levissima, Cariplo Foundation, Osram Spa, AEM Spa, Arpa Lombardia, Lsi-LASTEM) and volunteers activity (members of Italian Alpine Club, National Corp of Alpine and Speleological Rescue and Italian Alpine Club - station of Valfurva, students of University and Politecnico of Milan).

The data analysis was performed in the framework of the COFIN PRIN Project 2008. The authors wish to thank the Stelvio National Park, the Commune of Valfurva, the Valfurva section of the Italian Alpine Club (CAI), the ARPA Lombardia and the ARPA Valle d'Aosta for their kind help and support. Moreover the authors wish also to thank Eraldo Meraldì, Paolo Turcotti, Roberto Chillemi and Adriano Greco for their fundamental technical assistance on the field.

The Italian Alps are property of University of Milan which signed an apposite agreement with Ev-K2-CNR Committee for a joint managemet of these stations in the framework of the SHARE project.

6. SHARE Partner

- CNR - Institute for Atmospheric and Climate Sciences – Italy
- Department of Earth Sciences “Ardito Desio” – University of Milan - Italy
- Nepal Academy of Science & Technology – Nepal
- Department of Hydrology and Meteorology – Nepal
- Pakistan Meteorological Department – Pakistan
- World Meteorological Organization (WMO)
- United Nations Environment Programme (UNEP)
- Universidad Mayor de San Andres acting on behalf of the Instituto de Investigaciones Fisicas de La Paz
